Atlas Upload Service — Release Requirements

Fictional test artifact • Version 1.0 • Approved for test planning

1. Purpose and scope

• This document defines acceptance requirements for the fictional Atlas Upload Service, release candidate RC-7.

• The requirements below are normative. They describe intended behavior and do not establish what the implementation currently does.

2. Requirements

ID	Requirement
REQ-UP-01	The service must reject any individual uploaded file larger than 10 MiB.
REQ-UP-02	When a file is rejected because it exceeds the upload-size limit, the API must return HTTP 413.
REQ-RT-01	For a transient upstream failure, the client must make no more than 3 total attempts, including the initial attempt.
REQ-RT-02	Retries must stop immediately for non-retryable client errors, including HTTP 400.
REQ-QA-01	Before release approval, QA must execute tests for the upload limit, oversized-upload response, and transient-failure retry policy.

3. Acceptance criteria

• AC-01: A 10 MiB file is accepted, assuming all other validation passes.

• AC-02: A 12 MiB file is rejected with HTTP 413.

• AC-03: A transient failure results in at most 3 total attempts.

• AC-04: The release checklist records actual execution results for AC-01 through AC-03.

4. Status note

• This requirements document was approved for test planning. It contains no execution logs, runtime measurements, or proof that the service satisfies these requirements.
