Atlas Upload Service — Implementation & Configuration Notes

Fictional test artifact • RC-7 candidate • Engineering notes, not runtime proof

1. Purpose and evidence status

• This document records the intended RC-7 configuration and implementation notes supplied by the engineering team.

• These notes are not a runtime snapshot and do not, by themselves, prove deployed behavior or successful test execution.

2. Configuration values

Setting	Recorded value	Context
upload.max_file_size	25 MiB	Value in the proposed RC-7 application configuration.
upstream.retry.max_attempts	5 total attempts	Includes the initial request according to the configuration note.
upload.too_large.status_code	HTTP 400	Documented error mapping for the file-too-large exception.

3. Implementation notes

• The upload handler is intended to validate the configured maximum size before forwarding a file to downstream processing.

• The retry wrapper is intended to retry transient upstream failures and stop after the configured attempt count.

• The error-mapping note associates the file-too-large exception with HTTP 400. No request/response trace is attached to this document.

4. Verification status

• The acceptance-test checklist was prepared for QA. This document does not state that the checklist was executed.

• No deployed environment identifier, configuration hash, test-run ID, or runtime measurement is included.
