# Atlas Upload Service — QA Execution Report

Fictional test artifact • Staging • Run QA-RC7-2026-10-27-04

## 1. Execution metadata

• Service: Atlas Upload Service

• Build label recorded by QA: RC-7 candidate

• Environment: staging

• Run ID: QA-RC7-2026-10-27-04

• This report contains observations from the executions explicitly listed below. It is not a complete release sign-off.

## 2. Executed tests and observations

| Test ID | Action | Recorded observation | Status |
|---|---|---|---|
| QA-UP-014 | Uploaded a 12 MiB file to the staging endpoint. | The request returned HTTP 413. Response capture attached to the run record. | PASS |
| QA-RT-009 | Triggered a transient upstream timeout and counted requests. | The client made 4 total attempts before reporting failure. | FAIL |
| QA-UP-011 | Uploaded a 10 MiB file. | Test was not executed in this run. | NOT RUN |

## 3. Unexecuted coverage

• The boundary test for a 25 MiB upload was not executed.

• The test for the configured file-too-large error mapping was not executed separately.

• The release checklist item AC-04 remains NOT RUN because the complete set of required acceptance tests has not been executed.

## 4. QA conclusion

• This run confirms only the outcomes listed in Section 2 for the stated staging build and environment.

• The HTTP 413 observation for a 12 MiB upload is consistent with the stated acceptance criterion, but does not establish the configured maximum size or behavior for all file sizes.

• The four-attempt observation conflicts with the requirement for no more than three total attempts. Further investigation is required to establish which deployed configuration or code path produced the behavior.

• No conclusion is provided here about production behavior.
