REALITYCHECK SAMPLE EVIDENCE DOCUMENT

Document ID: RC-PDF-DEMO-001

Document type: Internal product requirement and verification plan

Version: 1.0 **Owner:** Product Engineering **Status:** Demo sample

1. Purpose

RealityCheck compares stated requirements, implementation details, configuration, and observed behavior. Each finding should retain its source and should distinguish verified facts from assumptions.

2. Requirements

ID	Requirement
R-001	The application accepts plain-text (.txt) and PDF (.pdf) evidence files.
R-002	The maximum upload size is configurable; the default demo setting is 50 MB.
R-003	An accepted upload returns a job identifier without waiting for extraction to finish.
R-004	A user can check a job's processing status.
R-005	Extracted evidence includes provenance identifying its source.
R-006	Evidence cannot be retrieved as complete while extraction is still running.
R-007	Completed job records and stored artifacts are removed after the configured retention period.

3. Implementation notes

• The HTTP API is implemented with FastAPI.

• Uploaded artifacts are stored under a configured local data directory.

• Extraction jobs are tracked in a SQLite database.

• A bounded in-process queue limits the number of pending jobs.

• Text extraction expects UTF-8 input; PDF extraction uses a document-parsing runtime.

• The React frontend is served by Vite during local development.

4. Sample observations to verify

ID	Sample observation	How to verify
OBS-001	A valid PDF upload returns an accepted response and job ID.	Upload this file and inspect the response.
OBS-002	The frontend polls status until extraction reaches a terminal state.	Watch the status change in the UI.
OBS-003	Extracted evidence includes source/provenance information.	Open the completed job's evidence view.
OBS-004	Unsupported file types are rejected.	Try a file with an unsupported extension.
OBS-005	An oversized upload is rejected before extraction.	Try the separately provided oversized PDF.

5. Known limitations

This is illustrative demo content, not proof that the listed behaviors have been verified. The demo is intended for local development and does not provide user authentication. Its in-process queue is designed for a single API process. Complex diagrams and handwritten notes are outside this sample's scope.

6. Review questions

- Which requirements can be checked directly against the API implementation?
- Which observations require an actual test before being marked verified?
- What evidence would confirm the configured upload-size limit?
- What are the risks of running this demo beyond localhost?
